

## **Providing Access to Museum Linked Data via International Image Interoperability Framework (IIIF)**

Robert Sanderson

Semantic Architect, Getty Trust

The IIIF community (<http://iiif.io/>) has designed and implemented systems that make it easy to interact with cultural heritage data, enabling developers to build diverse and engaging client applications. This has generated a vibrant international community dedicated to interoperability between systems, allowing images and descriptions of cultural heritage objects and collections to be shared and integrated seamlessly across institutions in a variety of environments. This presentation will outline the progress towards IIIF support within the Getty's programs, focusing on the Museum and Vocabulary work, and demonstrate the use cases and value for making content available in this way.
